Package ‘Deducer’

December 29, 2015

Version  0.7-9
Date  2015-12-28
Title  A Data Analysis GUI for R
Author  Ian Fellows with contributions from others (see documentation).
Maintainer  Ian Fellows <ian@fellstat.com>
Description  An intuitive, cross-platform graphical data analysis system. It uses menus and di-
alogs to guide the user efficiently through the data manipulation and analysis pro-
cess, and has an excel like spreadsheet for easy data frame visualization and editing. De-
ducer works best when used with the Java based R GUI JGR, but the di-
alogs can be called from the command line. Dialogs have also been integrated into the Win-
dows Rgui.
Depends  R (>= 2.15.0), ggplot2 (>= 2.0.0), JGR(>= 1.7-10), car, MASS
Imports  rJava, e1071, scales, plyr, foreign, multcomp, effects
Suggests  lawstat, Hmisc, XLConnect
SystemRequirements  Java (>= 1.4), JRI
License  GPL-2
NeedsCompilation  no
Repository  CRAN
Date/Publication  2015-12-29 22:16:31

add.cross.strata.test  

Apply a Stratified test to a Contingency Table

Description

Applies and adds a hypothesis test to a contingency.tables object.

Usage

add.cross.strata.test(tables, name, htests, types=c("asymptotic","monte.carlo","exact"))
**Arguments**

- **tables**: An object of class `contingency.tables`
- **name**: The name of the hypothesis test
- **htests**: A function or list of functions which take a three dimensional array as its argument and returns an object of class `htest`
- **types**: A character vector with the same number of items as htests, indicating what type of test was done

**Value**

A `contingency.tables` object identical to `tables`, but with the test applied to each table.

**See Also**

- `add.mantel.haenszel`
- `add.test`

**Examples**

```r
dat <- data.frame(a=rnorm(100)>.5,b=rnorm(100)>0,c=rnorm(100)>-.5)
tables <- contingency.tables(
  row.vars=a,
  col.vars=b,
  stratum.var=c, data=dat)
add.cross.strata.test(tables,"Mantel-Haenszel",list(function(x) mantelhaen.test(x,correct=FALSE)),
  "asymptotic")
tables
```

---

**Description**

Applies and adds the Cochran-Mantel-Haenszel test to a `contingency.tables` object. The Cochran-Mantel-Haenszel tests the independence of two nominal variables, stratified by a third nominal variable, assuming no three way interaction.

**Usage**

```r
add.mantel.haenszel(tables, conservative=FALSE)
```

**Arguments**

- **tables**: An object of class `contingency.tables`
- **conservative**: Should a continuity 'correction' be applied
Details

This is a convenience function wrapping mantelhaen.test in an add.cross.strata.test call. See mantelhaen.test for further details.

Value

A contingency.tables object identical to tables, but with the test applied to each table.

See Also

add.cross.strata.test add.test mantelhaen.test

Examples

dat<-data.frame(a=rnorm(100)>.5,b=rnorm(100)>0,c=rnorm(100)>(-.5))
tables1<-contingency.tables(
  row.vars=a,
  col.vars=b,
  stratum.var=c, data=dat)
tables1<-add.mantel.haenszel(tables1)
print(tables1, prop.r=TRUE, prop.c=TRUE, prop.t=FALSE)

---

add.test

Apply a test to a Contingency Tables object

Description

Applies and adds a test to a contingency.tables object.

Usage

add.test(tables, name, htests, types=c("asymptotic","monte.carlo","exact"))

add.chi.squared(tables, simulate.p.value = FALSE, B = 10000)

add.likelihood.ratio(tables, conservative = FALSE, simulate.p.value = FALSE, B = 10000)

add.fishers.exact(tables, simulate.p.value = FALSE, B = 10000)

add.correlation(tables, method=c("spearman","kendall"))

add.kruskal(tables, nominal=c("both","rows","cols"))
add.test

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tables</td>
<td>An object of class contingency.tables</td>
</tr>
<tr>
<td>name</td>
<td>Name of the test</td>
</tr>
<tr>
<td>htests</td>
<td>A function or list of functions which take a matrix as its argument and return an object of class htest</td>
</tr>
<tr>
<td>types</td>
<td>A character vector with the same number of items as htests, indicating what type of test was done</td>
</tr>
<tr>
<td>conservative</td>
<td>Should a conservative p-value be computed. i.e. One with a continuity correction for asymptotic tests and not using the mid p-value for exact and approximate tests</td>
</tr>
<tr>
<td>simulate.p.value</td>
<td>If TRUE p-values will be computed via monte carlo simulation</td>
</tr>
<tr>
<td>B</td>
<td>the number of samples for the monte carlo simulation</td>
</tr>
<tr>
<td>method</td>
<td>the type of correlation</td>
</tr>
<tr>
<td>nominal</td>
<td>Should the rows or columns be considered nominal.</td>
</tr>
</tbody>
</table>

Details

add.test applies a supplied list of tests to all of the tables in tables.

add.chi.squared is a wrapper function applying the chisq.test function to each table. add.likelihood.ratio is a wrapper function applying the likelihood.test function to each table. add.fishers.exact is a wrapper function applying the fisher.test function to each table. add.correlation is a wrapper function applying the cor.test function to each table. add.kruskal is a wrapper function applying the kruskal.test function to each table.

Value

A contingency.tables object identical to tables, but with the test applied to each table.

See Also

add.cross.strata.test likelihood.test cor.test kruskal.test

Examples

dat<-data.frame(a=rnorm(100)>0.5,b=rnorm(100)>0,c=rnorm(100)>(-0.5))
tables<-contingency.tables(  row.vars=a,  col.vars=b,  stratum.var=c,data=dat)
tables<-add.chi.squared(tables,simulate.p.value=TRUE,B=10000)
tables<-add.likelihood.ratio(tables)
tables<-add.fishers.exact(tables)
tables<-add.correlation(tables,method='kendall')
tables<-add.kruskal(tables)
tables<-add.mantel.haenszel(tables)
print(tables)
remove(tables)
as.matrix.cor.matrix  as.matrix method

Description
as matrix

Usage
## S3 method for class 'cor.matrix'
as.matrix(x,...)

Arguments
x  Object of class "cor.matrix".
...  further arguments. unused

Value
a matrix

chi.noncentral.conf  Non-central Chi-Squared Confidence Interval

Description
Confidence interval for the Non-centrality parameter of Non-central chi-squared distribution

Usage
chi.noncentral.conf(chival,df,conf,prec=.00001)

Arguments
chival  The observed Chi-Squared value
conf  The confidence level (e.g. .95)
df  Degrees of freedom
prec  Precision of estimate

Value
A 2X2 matrix whose rows represent the upper and lower bounds, and whose columns represent the parameter value and upper tail percentiles.
References

See Also

Chisquare

Examples

    chi.noncentral.conf(6,1,.95)
    # Result:
    
    #    Non-Central  %
    #Lower  0.2089385 0.97500899
    #Upper  19.4443359 0.02499302

Description

Makes a nice table out of a contin.tests object

Usage

    contin.tests.to.table(tests,test.digits=3,...)

Arguments

tests a contin.tests object
test.digits The number of digits to round to
... other parameters

Value

A nice table
contingency.tables  Contingency Tables

Description

Creates a contingency.tables object

Usage

contingency.tables(row.vars, col.vars, stratum.var, data=NULL, missing.include=FALSE)

Arguments

row.vars    A variable or data frame evaluated in data
col.vars    A variable or data frame evaluated in data
stratum.var A variable evaluated in data
data        A data.frame
missing.include
            A logical indicating whether a missing category should be included in the table

Value

A list with class "contingency.tables." Each element of the list is a single contingency table of class "contin.table" corresponding to each combination of elements of row.vars and col.vars stratified by stratum.var

See Also

extract.counts

Examples

temp.data<-data.frame(a=rnorm(100)>0,b=rnorm(100)>0,gender=rep(c("male","female"),50))
#a vs. b stratified by gender
tab<-contingency.tables(a,b,gender,data=temp.data)
tab

#add in chi-squared tests
tab<-add.chi.squared(tab)
tab
cor.matrix

Description

Creates a correlation matrix

Usage

```
cor.matrix(variables, with.variables, data=NULL, test=cor.test, ...)
```

Arguments

- `variables` / `variables`  
  An optional set of variables to correlate with variables. If nothing is specified, all variables in variables are correlated with themselves.
- `with.variables`  
  A data.frame from which the variables and factor will be selected.
- `data`  
  A function whose first two arguments are the variables upon which the correlation will be calculated, and whose result is an object of class htest.
- `test`  
  Further arguments for test.

Value

A multi.test object, representing a table of the results of func applied to each of the variables.

See Also

`cor.test` `as.matrix` `cor.matrix`

Examples

```
dat <- data.frame(aa=rnorm(100), bb=rnorm(100), cc=rnorm(100), dd=rnorm(100))
dat$aa <- dat$aa + dat$dd
dat$cc <- dat$cc + dat$aa
cor.matrix(dat, test=cor.test)
cor.matrix(d(aa, cc), data=dat, test=cor.test, method="kendall")
cor.matrix(d(aa, cc), d(dd, bb), data=dat, test=cor.test, method="spearman")
```
Description

This function creates data frames, tightly coupled collections of variables which share many of the properties of matrices and of lists, used as the fundamental data structure by most of R’s modeling software. It is a keystroke saving wrapper for the data.frame function. The only difference is that check.names and stringsAsFactors are FALSE by default.

Usage

d(..., row.names = NULL, check.rows = FALSE,
   check.names = FALSE,
   stringsAsFactors = FALSE)

Arguments

...                     items
row.names              NULL or a single integer or character string specifying a column to be used as row names, or a character or integer vector giving the row names for the data frame.
check.rows             if TRUE then the rows are checked for consistency of length and names.
check.names            logical. If TRUE then the names of the variables in the data frame are checked to ensure that they are syntactically valid variable names and are not duplicated. If necessary they are adjusted (by make.names) so that they are.
stringsAsFactors       logical: should character vectors be converted to factors?

Examples

x <- d(rnorm(10),1:10)
**deducer**

**GUI Access functions**

**Description**

splits a variable into two groups

**Usage**

deducer(cmd=NULL)

data.viewer()

**Arguments**

cmd  The command to be executed

**deducer.addMenu**

**Controls Deducer’s command line menus**

**Description**

Controls Deducer’s command line menus

**Usage**

deducer.addMenu(name, pos=length(menus)+1)
deducer.setMenus(newMenus)
deducer.getMenus()
deducer.addMenuItem(name, pos=NULL, command, menuName, silent=TRUE)
menuFunctions()

**Arguments**

name  name of item or menu to add
pos  position at which to add the item or menu
menuName  the name of the menu to add the item to
command  A character vector representing the R command to be run
silent  Should the command be executed silently
newMenus  new menus
Examples

```r
#add a menu with two items
deducer.addMenu("TestMenu")
deducer.addMenuItem("test1", "cat('test1 selected')", "TestMenu")
deducer.addMenuItem("test2", "print(summary(lm(rnorm(100)-rnorm(100))))", "TestMenu")

#Add menu to gui if applicable
if(.windowsGUI){
  winMenuAdd("TestMenu")
  winMenuAddItem("TestMenu", "test1", "cat('test1 selected')")
  winMenuAddItem("TestMenu", "test2", "print(summary(lm(rnorm(100)-rnorm(100))))")
} else if(.jgr){
  jgr.menuAdd("TestMenu")
  jgr.menuAddItem("TestMenu", "test1", "cat('test1 selected')")
  jgr.menuAddItem("TestMenu", "test2", "print(summary(lm(rnorm(100)-rnorm(100))))")
}
```

descriptive.table  

**Table of Descriptives**

Description

Table of descriptive statistics, possibly stratified

Usage

descriptive.table(vars, strata, data, func.names = c("Mean","St. Deviation","Median", "25th Percentile","75th Percentile", "Minimum","Maximum","Skew","Kurtosis","Valid N"), func.additional)

Arguments

- **vars**
  A variable or data.frame containing variables on which to run descriptive statistics.
- **data**
  The data frame in which vars is evaluated
- **strata**
  A variable or data.frame containing variables on which to stratify
- **func.names**
  A character vector of built-in statistics
- **func.additional**
  A named list of functions. Each function should take a numeric vector as its argument, and return a single value
Value

Returns a list of matrix objects containing descriptive information on all variables in dat. One for each level or combination of levels in strata.

See Also

frequencies mean by

Examples

data(mtcars)
# means and standard deviations
descriptive.table(vars = d(mpg, hp), data = mtcars,
func.names = c("Mean", "St. Deviation", "Valid N"))

# stratifying by cyl
descriptive.table(vars = d(mpg, hp),
strata = d(cyl), data = mtcars,
func.names = c("Mean", "St. Deviation", "Valid N"))

func.list = list(mean.deviance = function(x) mean(abs(x - mean(x))))

# Adding deviance as a statistic
descriptive.table(vars = d(mpg, hp),
strata = d(cyl), data = mtcars,
func.names = c("Mean", "St. Deviation", "Valid N"), func.additional = func.list)
Arguments

container: A Java Swing container with Anchor layout
component: a Java Swing component
top: location of top of component 0 - 1000
right: location of right of component 0 - 1000
bottom: location of bottom of component 0 - 1000
left: location of left of component 0 - 1000
topType: Type of constraint on top of component. Can be "REL", "ABS", or "NONE"
rightType: Type of constraint on right of component. Can be "REL", "ABS", or "NONE"
bottomType: Type of constraint on bottom of component. Can be "REL", "ABS", or "NONE"
leftType: Type of constraint on left of component. Can be "REL", "ABS", or "NONE"
height: new height of component or window in pixels
width: new width of component or window in pixels
cmd: the command to be executed

details

addComponent adds a Java object of class Component to a container (usually an RDialog or SimpleRDialog). the location of the component is determined by the top, right, bottom, and left arguments, which are numbers between 1 and 1000 indicating the distance from either the top (or left) of the container, with 1000 indicating the opposite side of the container. Each side can be constrained in three different ways. If the Type is "REL", the side will scale proportional to the container when the container is resized. If it is "ABS", it is not rescaled. If it is "NONE", the location of that side is determined by the component’s preferred size, which can be set with the “setPreferedSize” method.

getSize gets the height and width

setSize sets the height and width

eexecute executes a character representing a command, as if it were entered into the console

The rest of the items are references to the Java classes of commonly used GUI components. see www.deducer.org for more details and usage.
**dich**

**Description**

splits a variable into two groups

**Usage**

dich(variables, data=NULL, cut=NULL, group1=NULL, group2=NULL)

**Arguments**

- **variables**: variables to be dichotomized
- **data**: A data.frame
- **cut**: An optional cut point dividing factor into two groups.
- **group1**: An optional vector of levels of factor defining group 1.
- **group2**: An optional vector of levels of factor defining group 2.

**Value**

a data.frame containing the variables, recoded into two groups.

**extract.counts**

**Extract Contingency Table Arrays**

**Description**

Extracts the counts of a contingency.tables object

**Usage**

extract.counts(tables)

**Arguments**

- **tables**: A contingency.table object

**Value**

A named list of three dimensional arrays. One for each contin.table in tables

**See Also**

contingency.tables
frequencies

Examples

temp.data<-data.frame(a=rnorm(100)>0,b=rnorm(100)>0,gender=rep(c("male","female"),50))
#a vs. b stratified by gender
	tab<-contingency.tables(a,b,gender,data=temp.data)
	tab

##extract counts
eextract.counts(tab)

##Yields something like the following:
#$\text{a by b}$
#$\text{, , female}$
#$\begin{array}{ll}
#\text{FALSE} & 11 \\
#\text{TRUE} & 15 \\
#\end{array}$
#$\text{, , male}$
#$\begin{array}{ll}
#\text{FALSE} & 10 \\
#\text{TRUE} & 22 \\
#\end{array}$

---

frequencies  Frequency Tables

Description

Creates a set of frequency tables.

Usage

frequencies(data,r.digits=1)

Arguments

data  A data.frame containing the variables on which to run frequencies
r.digits  how many digits should the percentages be rounded to

Value

Returns a list of freq.table objects. One for each variable in data.

See Also

tab xtabs descriptive.table prop.table
get.objects

Examples

dat <- data.frame(rnorm(100), trunc(runif(100, 0, 5)))
# rounding to 1
frequencies(dat)
# rounding to 4
frequencies(dat, 4)

get.objects  get objects

Description

Enumerates all objects of a certain class

Usage

gget.objects(cn, env = globalenv(), includeInherited = TRUE)

Arguments

 cn The name of the class
 env environment to look in
 includeInherited Should objects inheriting cn be included

Value

a character vector

ggcocorplot  Correlation matrix

Description

Plots a correlation matrix

Usage

ggcocorplot(cor.mat, data=NULL, lines=TRUE, line.method=c("lm", "loess"),
            type="points", alpha=.25, main="auto", var.text.size=5,
            cor.text.limits=c(5,25), level=.05)
Arguments

- `cor.mat`: a `cor.matrix` object to plot
- `data`: the data.frame used to compute the correlation matrix
- `lines`: Logical. Should regression lines be drawn.
- `type`: type of plot. "points" or "bins"
- `line.method`: Character. Type of regression line.
- `alpha`: numeric. level of alpha transparency for the points.
- `main`: Title of the plot. defaults to the method of `cor.mat`.
- `var_text_size`: size of the diagonal variable names.
- `cor_text_limits`: lower and upper bounds for the size of the correlation text.
- `level`: the size of the test differentiated by text color.

Author(s)

Mike Lawrence and Ian Fellows

See Also

cor.matrix qscatter_array

Examples

data(mtcars)
corr.mat1<-cor.matrix(variables=d(mpg,carb,carb+rnorm(length(carb))),
data=mtcars,
test=cor.test,
method='spearman',
alternative="two.sided",exact=FALSE)

p<-ggcorplot(corr.mat1,data = mtcars)
print(p)
## Not run:

has.hex<-require("hexbin")
if(has.hex)
{
data(diamonds)
corr.mat<-cor.matrix(variables=d(price,carat,color),
data=diamonds,
test=cor.test,
method='spearman',
alternative="two.sided")

pl <- ggcorplot(corr.mat=corr.mat,data=diamonds,type="bins",
cor_text_limits=c(5,15),
lines=FALSE)
print(pl)
rm('corr.mat')
k.sample.test

}  

## End(Not run)

---

k.sample.test  

*K Sample Test*

---

**Description**

Performs a K independent sample test.

**Usage**

```r
k.sample.test(formula, data, test=oneway.test, ...)
```

**Arguments**

- **formula**: A formula, the left hand side of which indicated the outcomes, and the right hand side of which contains the factor.
- **data**: A data.frame.
- **test**: A function whose first argument is a formula with the outcome on the lhs and the factor on the rhs. The second argument should be the data to be used for the formula. The result of the function should be an object of class `htest`.
- **...**: Further arguments for `func`.

**Value**

A `multi.test` object, representing a table of the results of `func` applied to each of the variables.

**See Also**

`oneway.test`  
`kruskal.test`  
`wilcox.test`

**Examples**

```r
dat<-data.frame(a=rnorm(100),b=rnorm(100),c=rnorm(100),d=cut(rnorm(100),4))
k.sample.test(d(a,b)-d,dat)
k.sample.test(dat[,4]-dat$d, var.equal=TRUE)
k.sample.test(d(a,c)-d,dat,kruskal.test)
```
**likelihood.test**  
*Likelihood Ratio (G test) for contingency tables*

**Description**

Performs a likelihood ratio test of independence

**Usage**

`likelihood.test(x,y=NULL,conservative=FALSE)`

**Arguments**

- **x**  
  A vector or a matrix

- **y**  
  A vector that is ignored if `x` is a matrix and required if `x` is a vector

- **conservative**  
  If `true`, the Williams’ continuity correction is used

**Value**

A list with class "htest" containing the following components:

- **statistic**  
  the value the chi-squared test statistic.

- **parameter**  
  the degrees of freedom of the approximate chi-squared distribution of the test statistic.

- **p.value**  
  the p-value for the test.

- **method**  
  a character string indicating the type of test performed, and whether the continuity correction was used.

- **data.name**  
  a character string giving the name(s) of the data.

**Author(s)**

Pete Hurd and Ian Fellows

**See Also**

`chisq.test`

**Examples**

```r
data(InsectSprays)
likelihood.test(InsectSprays$count>7, InsectSprays$spray)
```

multi.test

Description
Creates a table from a list of htests

Usage
multi.test(tests)

Arguments
tests A named list of htest objects representing the same test applied to a number of different conditions or variables.

Value
A multi.test object, representing a table of the htest objects.

one.sample.test

Description
Performs a one sample test.

Usage
one.sample.test(variables,data=NULL,test=t.test,...)

Arguments
variables A variable or dataframe of variables
data The data frame in which variables is evaluated
test A function whose first argument is the sample to be tested, and whose result is an object of class htest.
... further arguments for func

Value
A multi.test object, representing a table of the results of test applied to each of the variables.

See Also
t.test shapiro.test
Examples

```
data(anorexia)

# are subjects' weights at baseline and endpoint significantly different from normal
one.sample.test(variables=d(Prewt,Postwt),
  data=anorexia,
  test=shapiro.test)

# does CBT work at increasing mean wt
anorexia.sub<-subset(anorexia,Treat=="CBT")
one.sample.test(variables=Postwt-Prewt,
  data=anorexia.sub,
  test=t.test)
```

Description

plots for one sample tests

Usage

```
onesample.plot(variables,data=NULL,test.value,scale=FALSE,type="hist",alpha=.2)
```

Arguments

- **variables**: An expression denoting a set of variable.
- **data**: A data.frame from which the variables will be selected.
- **test.value**: null hypothesis test value
- **scale**: scale variables
- **type**: type of plot. 'hist' or 'box' are allowed
- **alpha**: transparency of points for box plot

Examples

```
data(mtcars)
oneSample.plot(variables=d(mpg,cyl,disp,hp,drat,wt,qsec,vs,am,
  gear,carb),data=mtcars,type='hist')
oneSample.plot(variables=d(mpg,cyl,disp,hp,drat,wt,qsec,vs,am,
  gear,carb),data=mtcars,type='box',alpha=1)
```
oneway.plot

One Way Plot

Description
plots a categorical variable against a series of continuous variables

Usage
oneway.plot(formula, data=NULL, alpha=.2,
box=TRUE, points=TRUE, scale=FALSE)

Arguments
formula
A formula, the left hand side of which indicated the outcomes, and the right
hand side of which contains the factor

data
A data.frame

alpha
alpha transparency level for the points.

box
prints boxplot

points
prints jitter plot

scale
standardize the variables prior to plotting

Value
a ggplot object

Examples
oneway.plot(d(DriversKilled, drivers, front, rear, kms, PetrolPrice)-law, as.data.frame(Seatbelts))

perm
Vector Permutations

Description
Enumerates all permutations of a vector

Usage
perm(vec, duplicates=FALSE)
Arguments

vec          The vector to permute
_duplicates   Should duplicate permutations be listed

Value

Returns a matrix where each row is a permutation of vec. All possible permutations are listed, and if duplicates=TRUE, non-unique permutations are also listed.

See Also

sample

Examples

perm(1:4)
perm(LETTERS[4:8])

Description

Two Sample t-test via montecarlo permutation

Usage

perm.t.test(x, y, statistic=c("t","mean"), alternative=c("two.sided", "less", "greater"), midp=TRUE, B=10000)

Arguments

x          a numeric vector containing the first sample
y          a numeric vector containing the second sample
statistic  The statistic to be permuted. See details
alternative The alternative hypothesis
midp        should the mid p-value be used
B           The number of monte-carlo samples to be generated

Details

This function performs a two sample permutation test. If the mean is permuted, then the test assumes exchangability between the two samples. If the t-statistic is used, the test assumes either exchangability or a sufficiently large sample size. Because there is little lost in the way of power, and the assumptions are weaker, the t-statistic is used by default.
plot.cor.matrix

Value

A list with class "htest" containing the following components:

- statistic: The observed value of the statistic.
- p.value: the p-value for the test.
- method: a character string indicating the type of test performed.
- data.name: a character string giving the name(s) of the data.
- B: The number of samples generated
- alternative: the direction of the test

Plot method

Description

Produces a circle plot for an object of class "plot.cor.matrix"

Usage

## S3 method for class 'cor.matrix'
plot(x,y=NULL,size=10,...)

Arguments

- x: Object of class "cor.matrix".
- y: unused
- size: maximum radius size
- ...: further arguments, unused

Value

a ggplot object
print.contin.table  Print method

Description

Print object of class "contin.table" in nice layout.

Usage

```r
## S3 method for class 'contin.table'
print(
  x, digits=3, prop.r=TRUE, prop.c=TRUE, prop.t=TRUE,
  expected.n=FALSE, residuals=FALSE, std.residuals=FALSE,
  adj.residuals=FALSE, no.tables=FALSE, ...
)
```

Arguments

- `x` Object of class "contin.table".
- `digits` Number of digits to round to.
- `prop.r` Logical. print row proportions.
- `prop.c` Logical. print column proportions.
- `prop.t` Logical. print proportions.
- `expected.n` Logical. print expected cell counts.
- `residuals` Logical. print residuals.
- `std.residuals` Logical. print standardized residuals.
- `adj.residuals` Logical. print Adjusted residuals
- `no.tables` Logical. Suppress tables
- `...` further arguments

Value

none

Author(s)

Ian Fellows based on the CrossTable function from the gmodels package maintained by Gregory R. Warnes
print.contin.tests  

Print method

Description
Print object of class "contin.tests" in nice layout.

Usage
```r
## S3 method for class 'contin.tests'
print(x,test.digits, ...)
```

Arguments
- `x`: Object of class "contin.tests".
- `test.digits`: Number of digits to be printed
- `...`: further arguments to be passed to or from methods.

Value
`none`

print.contingency.tables  

Print method

Description
Print object of class "contingency.tables" in nice layout.

Usage
```r
## S3 method for class 'contingency.tables'
print(x,digits=3,prop.r=TRUE,prop.c=TRUE,prop.t=TRUE,
      expected.n=FALSE,no.tables=FALSE,...)
```

Arguments
- `x`: Object of class "contin.table".
- `digits`: Number of digits to round to.
- `prop.r`: Logical. print row proportions.
- `prop.c`: Logical. print column proportions.
- `prop.t`: Logical. print proportions.
- `expected.n`: Logical print expected cell counts.
- `no.tables`: Logical. Suppress tables
- `...`: further arguments
### print.cor.matrix

**Print method**

**Description**

Print object of class "cor.matrix" in nice layout.

**Usage**

```r
## S3 method for class 'cor.matrix'
print(x, digits=4, N=TRUE, CI=TRUE, stat=TRUE, p.value=TRUE, ...)
```

**Arguments**

- `x`: Object of class "cor.matrix".
- `digits`: Number of digits to round to.
- `N`: Logical. print a row for sample size.
- `CI`: Logical. print a row for confidence intervals if they exist.
- `stat`: Logical. print a row for test statistics.
- `p.value`: Logical. print a row for p-values.
- `...`: Further arguments

**Value**

- `none`

### print.freq.table

**Print method**

**Description**

Print object of class "freq.table" in nice layout.

**Usage**

```r
## S3 method for class 'freq.table'
print(x, ...)
```

**Value**

- `none`
print.multi.test

Arguments

x Object of class "freq.table".

... further arguments

Value

none

print.multi.test Print method

Description

Print object of class "multi.test" in nice layout.

Usage

## S3 method for class 'multi.test'
print(x,...)

Arguments

x Object of class "multi.test".

... further arguments

Value

none

qscatter_array qscatter_array

Description

Creates an array of scatterplots

Usage

qscatter_array(variables,with.variables,data,x.lab="",y.lab="", main="Correlation Array",common.scales=TRUE,alpha=.25)
Arguments

variables variables
with.variables An optional set of variables to correlate with variables. If nothing is specified,
all variables in variables are correlated with themselves.
data A data.frame from which the variables will be selected.
x.lab A label for the x axis
y.lab A label for the y axis
main A label for the plot
common.scales should common x and y scales be used.
alpha alpha transparency

Examples

data(mtcars)
qscatter_array(d(cyl, disp, hp, drat),
data=mtcars) + geom_smooth(method="lm")
qscatter_array(d(cyl, disp, hp, drat),d(wt, carb),data=mtcars,common.scales=FALSE)

recode.variables Recode

Description

Recodes a set of variables according to a set of rules

Usage

recode.variables(data, recodes)

Arguments

data A data.frame to be recoded
recodes Definition of the recoding rules. See details

Details

recode contains a set of recoding rules separated by ";". There are three different types of recoding
rules:
1. The simplest codes one value to another. If we wish to recode 1 into 2, we could use the rule
"1->2;".
2. A range of values can be coded to a single value using "1:3->4;". This rule would code all
values between 1 and 3 inclusive into 4. For factors, a value is between two levels if it is between
them in the factor ordering. One sided ranges can be specified using the Lo and Hi key words
(e.g."Lo:3->0; 4:Hi->1")
3. Default conditions can be coded using "else." For example, if we wish to recode all values >=0
to 1 and all values <0 to missing, we could use ("0:Hi->1; else->NA")
Value
returns a recoded data.frame

Author(s)
Ian Fellows adapted from code by John Fox

See Also
cut recode in package `car`

Examples
```r
data<-data.frame(a=runif(100),b=runif(100),male=runif(100)>0)
recode.variables(data[c("a","b")], "Lo:0 -> 0;Hi:1 -> 1;")
data["male"] <- recode.variables(data["male"], "1 -> 'Male';0 -> 'Female';else -> NA;")
```

---

rocplot

ROC Plot for a logistic regression model

Description
Plots the ROC Curve

Usage
```r
rocplot(logistic.model, diag=TRUE, pred.prob.labels=FALSE, prob.label.digits=3, AUC=TRUE)
```

Arguments
- logistic.model: a glm object with binomial link function.
- diag: a logical value indicating whether a diagonal reference line should be displayed.
- pred.prob.labels: a logical value indicating whether the predictive probabilities should be displayed.
- prob.label.digits: The number of digits of the predictive probabilities to be displayed.
- AUC: a logical value indicating whether the estimated area under the curve should be displayed.

Value
a ggplot object

Author(s)
Ian Fellows adapted from the lroc function by Virasakdi Chongsuvivatwong
sort.data.frame

Examples

```r
model.glm <- glm(formula=income~5930.5 ~ education + women + type,
                  family=binomial(),data=Prestige,na.action=na.omit)
rocplot(model.glm)
```

Description
Sorts a data frame

Usage

```r
## S3 method for class 'data.frame'
sort(x, decreasing, by, ...)
```

Arguments

- `x` A data.frame to be sorted
- `decreasing` unused
- `by` A character, a one sided formula, or an expression indicating the sorting order
- `...` further arguments

Details

If `by` is a formula, or a character vector coe-0rce-able into a formula, `x` is sorted by each element of the formula, with ties broken by subsequent elements. Elements preceded by a `'-` indicate descending order, otherwise ascending order is used. Parentheses or any formula operator other than `+` and `-` are ignored, so sorting by `a*b` will sort based on the product of `a` and `b`.

If `by` is not a formula, a `~` is appended to the left hand side of the call, and coerced into a formula. The decreasing argument is included for generic method consistency, and is not used.

Value

returns `x`, sorted.

Author(s)

Ian Fellows adapted from code by Ari Friedman and Kevin Wright

See Also

- `sort order`
Examples

data(mtcars)

# sort by the number of cylinders
sort(mtcars, by = -cyl)

# sort in descending order
sort(mtcars, by = -cyl)

# break ties with horse power
sort(mtcars, by = cyl + hp)

# randomly permute the data
sort(mtcars, by = rnorm(nrow(mtcars)))

# reverse order
sort(mtcars, by = nrow(mtcars):1)

# sort by squared deviation from mean hp
sort(mtcars, by = -(hp-mean(hp))^2)

# identical

summarylm

Summary table for a linear model

Description

Computes the coefficients, std. errors, t values, and p-values for a linear model in the presence of possible heteroskedasticity.

Usage

summarylm(object, correlation=FALSE, symbolic.cor = FALSE, white.adjust=FALSE,...)

Arguments

object an object of class lm.
correlation a logical value indicating whether parameter correlations should be printed.
symbolic.cor logical. If TRUE, print the correlations in a symbolic form (see symnum) rather than as numbers. Effective only if white.adjust is FALSE.
white.adjust value passed to hccm indicating the type of robust adjustment to be used. If TRUE, type is assumed to be ‘hc3’
... additional parameters passed to stats::summary.lm
Details

If white.adjust is false, the function returns a value identical to stats::summary.lm. Otherwise, robust summaries are computed.

Value

A summary table

Examples

```r
ctl <- c(4.17, 5.58, 5.18, 6.11, 4.50, 4.61, 5.17, 4.53, 5.33, 5.14)
trt <- c(4.81, 4.17, 4.41, 3.59, 5.87, 3.83, 6.03, 4.89, 4.32, 4.69)
group <- gl(2, 10, 20, labels=c("Ctl", "Trt"))
weight <- c((ctl-mean(ctl))*10+mean(ctl), trt)
lm.D9 <- lm(weight ~ group)
summary(lm.D9, white.adjust=TRUE)

ctl <- mean(ctl)
trt <- mean(trt)
summary(lm(weight ~ group), white.adjust=TRUE)
```

Description

Creates a data.frame from a table

Usage

```r
table.to.data(x)
```

Arguments

x

A matrix or table representing the cross tabulation of two variables

Value

A two column data.frame where each row is an observation and each column is a variable.

See Also

xtabs

Examples

```r
tab <- matrix(c(4, 5, 6, 9, 7, 3), ncol=3)
tab
table.to.data(tab)
```
two.sample.test

---

**two.sample.test**  
*Two Sample Test*

---

**Description**

Performs a two independent sample test.

**Usage**

two.sample.test(formula, data=NULL, test=t.test, ...)

**Arguments**

- **formula**: A formula, the left hand side of which indicated the outcomes, and the right hand side of which contains the factor
- **data**: A data.frame
- **test**: A function whose first two arguments are the two-samples to be tested, and whose result is an object of class htest.
- **...**: further arguments for test

**Value**

A `multi.test` object, representing a table of the results of test applied to each of the variables.

**See Also**

- `t.test`
- `ks.test`
- `wilcox.test`

**Examples**

dat <- data.frame(a=rnorm(100), b=rnorm(100), c=rnorm(100), d=rnorm(100) > -.5)
two.sample.test(d(a,b) ~ d, dat, ks.test)
two.sample.test(a ~ dich(b, cut=0) , dat, t.test)
two.sample.test(d(a^2, abs(b), c)-d, dat, wilcox.test)
