Package ‘spcosa’

March 30, 2018

Type Package

Title Spatial Coverage Sampling and Random Sampling from Compact Geographical Strata

Version 0.3-8

Date 2018-03-30

Description Spatial coverage sampling and random sampling from compact geographical strata created by k-means. See Walvoort et al. (2010) <doi:10.1016/j.cageo.2010.04.005> for details.

Depends R (>= 3.1.0), rJava (>= 0.9-3), methods, utils

Imports sp (>= 1.1-0), ggplot2 (>= 1.0.0)

Suggests grid, gstat, rgdal, rgl, RUnit, knitr

SystemRequirements Java (>= 6)

Description

Algorithms for spatial coverage sampling and for random sampling from compact geographical strata based on

\( k \)-means.

Details

The \texttt{spcosa}\textendash package provides algorithms for spatial coverage sampling and for random sampling from compact geographical strata based on \( k \)-means (see de Gruijter et al., 2006, Walvoort et al., 2010, and \texttt{kmeans}). S4-classes and methods are available for spatial coverage sampling, random sampling from compact geographical strata, and stratified simple random sampling for composites. In case of spatial coverage sampling, existing sampling points may be taken into account. See the package vignette for more information and examples.

Note

In order to get the \texttt{spcosa}\textendash package running, make sure that a recent version of Java (\( \geq 6 \)) is installed. Free Java downloads are available at \url{http://www.java.com}.

In case of problems, you may wish to consult the FAQ located at C:\Users\walvo001\AppData\Local\Temp\Rtmp6LmIDF\spcosa\FAQ.

Maintainer: Dennis Walvoort <dennis.walvoort@wur.nl>

References

CompactStratification-class

See Also

stratify for stratification, spsample for sampling, and estimate for inference.

CompactStratification-class

Class "CompactStratification"

Description

A class for storing a stratification with compact strata.

Objects from the Class

Objects can be created by calls of the form new("CompactStratification", cells, stratumId, centroids, mssd).
However, objects are usually created by calling stratify.

Slots

cells: Object of class "SpatialPixels", representing the area to be partitioned.
stratumId: Object of class "integer", indicating to which stratum each cell in cells belong.
centroids: Object of class "SpatialPoints", representing the centers of gravity of each stratum.
mssd: Object of class "numeric", representing the mean squared shortest distance.

Extends

Class "Stratification", directly.

Methods

coerce signature(from = "CompactStratification", to = "data.frame"): coerces to "data.frame".
coerce signature(from = "CompactStratification", to = "SpatialPixels"): coerces to "SpatialPixels".
coerce signature(from = "CompactStratification", to = "SpatialPixelsDataFrame"): coerces to "SpatialPixelsDataFrame".
estimate signature(statistic = "SamplingVariance", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame"): estimates the sampling variance. See "SamplingVariance" for more details.
estimate signature(statistic = "SpatialMean", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame"): estimates the spatial mean. See "SpatialMean" for more details.
estimate signature(statistic = "SpatialVariance", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame"): estimates the spatial variance. See "SpatialVariance" for more details.
estimate signature(statistic = "StandardError", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame"): estimates the standard error of the spatial mean. See "StandardError" for more details.
CompactStratificationEqualArea-class

**Description**

A class for storing a stratification with compact strata of equal size.

**Objects from the Class**

Objects can be created by calls of the form `new("CompactStratificationEqualArea", cells, stratumId, centroids, mssd)`. However, objects are usually created by calling `stratify`.

**Slots**

- **cells**: Object of class "SpatialPixels", representing the area to be partitioned.
- **stratumId**: Object of class "integer", indicating to which stratum each cell in cells belong.
- **centroids**: Object of class "SpatialPoints", representing the centers of gravity of each stratum.
- **mssd**: Object of class "numeric", representing the mean squared shortest distance.
CompactStratificationPriorPoints-class

Methods

estimate signature(statistic = "SpatialMean", stratification = "CompactStratificationEqualArea", samplingPattern = "SamplingPatternRandomComposite", data = "data.frame") estimates the spatial mean. See "SpatialMean" for more details.

spsample signature(x = "CompactStratificationEqualArea", n = "missing", type = "missing") returns the centers of gravity of each stratum.

spsample signature(x = "CompactStratificationEqualArea", n = "numeric", type = "missing") randomly selects \( n \) sampling points in each stratum.

spsample signature(x = "CompactStratificationEqualArea", n = "numeric", type = "character") randomly selects \( n \) sampling points in each stratum. if type = "composite", stratified simple random sampling of \( n \) composites.

CompactStratificationPriorPoints-class

Class "CompactStratificationPriorPoints"

Description

A class for storing a stratification with compact strata, given prior sampling locations.

Objects from the Class

Objects can be created by calls of the form new("CompactStratificationPriorPoints", cells, stratumId, centroids, mssd, priorPoints) However, objects are usually created by calling stratify.

Slots

priorPoints: Object of class "SpatialPoints", containing the coordinates of the existing locations.
cells: Object of class "SpatialPixels", representing the area to be partitioned.
stratumId: Object of class "integer", indicating to which stratum each cell in cells belong.
centroids: Object of class "SpatialPoints", representing the centers of gravity of each stratum.
mssd: Object of class "numeric", representing the mean squared shortest distance.

Extends

estimate-methods

Methods

spsample signature(x = "CompactStratificationPriorPoints", n = "missing", type = "missing"): returns the centers of gravity of strata without prior points in addition to the prior points.

Author(s)

Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter

Example

# Note: the example below requires the 'rgdal'-package.
# You may consider the 'maptools'-package as an alternative
if (require(rgdal)) {
  # read vector representation of the "Mijdrecht" area
  shp <- readOGR(
    dsn = system.file("maps", package = "spcosa"),
    layer = "mijdrecht"
  )

  # stratify into 30 strata
  myStratification <- stratify(shp, nStrata = 30, nTry = 10, verbose = TRUE)
# random sampling of two sampling units per stratum
mySamplingPattern <- spsample(myStratification, n = 2)

# plot sampling pattern
plot(myStratification, mySamplingPattern)

# simulate data
# (in real world cases these data have to be obtained by field work etc.)
myData <- as(mySamplingPattern, "data.frame")
myData$observation <- rnorm(n = nrow(myData), mean = 10, sd = 1)

# design-based inference
estimate("spatial mean", myStratification, mySamplingPattern, myData["observation"])
estimate("sampling variance", myStratification, mySamplingPattern, myData["observation"])
estimate("standard error", myStratification, mySamplingPattern, myData["observation"])
estimate("spatial variance", myStratification, mySamplingPattern, myData["observation"])
estimate("scdf", myStratification, mySamplingPattern, myData["observation"])

---

### getArea-methods

**Extract the Area of an Object**

#### Description

Methods for extracting the area of objects.

#### Methods

- **object** = "CompactStratification" returns the area of each stratum.

#### See Also

- [getRelativeArea](#)

---

### getCentroid-methods

**Extract Centroids**

#### Description

Methods for extracting centroids

#### Methods

- **object** = "CompactStratification" returns the centers of gravity of each stratum.
**getNumberOfStrata-methods**

*Extract the Number of Strata in an Object*

**Description**

Methods for extracting the number of strata of objects.

**Methods**

```r
object = "CompactStratification"  returns the number of strata in a compact stratification.
```

**getObjectiveFunctionValue-methods**

*Extract the Objective Function Value of an Object*

**Description**

Methods for extracting the objective function value.

**Methods**

```r
object = "CompactStratification"  extracts the mean squared shortest distance.
```

**getRelativeArea-methods**

*Extract the Relative Area of an Object*

**Description**

Methods for extracting relative areas of objects. The total area equals unity.

**Methods**

```r
object = "CompactStratification"  returns the relative area of each stratum. The sum of the relative areas equals 1.
```

**See Also**

`getArea`
getSampleSize-methods  
Extract the sample size of an object

Description
Methods for extracting the sample size.

Methods

- **object = "SamplingPattern"**  returns the sample size.
- **object = "SamplingPatternRandomComposite"**  returns the number of composites

plot-methods  
Visualizing Compact Stratifications and Sampling Patterns

Description
The plot method can be used to visualize compact stratifications and sampling patterns. Since it has been built on top of the ggplot2 package, functions provided by this package can be used to modify the plots.

Methods

- **x = "CompactStratification", y = "missing"**  plots stratification x.
- **x = "CompactStratification", y = "SamplingPattern"**  plots sampling pattern y on top of stratification x.
- **x = "CompactStratification", y = "SamplingPatternPriorPoints"**  plots sampling pattern y on top of stratification x.
- **x = "CompactStratification", y = "SamplingPatternRandomComposite"**  plots sampling pattern y on top of stratification x.
- **x = "SamplingPattern", y = "missing"**  plots sampling pattern x.
- **x = "SamplingPatternPriorPoints", y = "missing"**  plots sampling pattern x.
- **x = "SamplingPatternRandomComposite", y = "missing"**  plots sampling pattern x.

See Also

- ggplot2-package
SamplingPattern-class

Class "SamplingPattern"

Description
A class for storing a sampling pattern.

Objects from the Class
Objects can be created by calls of the form `new("SamplingPattern", ...)`. However, objects are usually created by calling `spsample`.

Slots
- `sample`: Object of class "SpatialPoints", containing the sampling locations.

Methods
- `coerce` signature(from = "SamplingPattern", to = "data.frame"): coerces to "data.frame".
- `coerce` signature(from = "SamplingPattern", to = "SpatialPoints"): coerces to "SpatialPoints".
- `getSampleSize` signature(object = "SamplingPattern"): returns the sample size.
- `plot` signature(x = "CompactStratification", y = "SamplingPattern"): plots sampling pattern y on top of stratification x.
- `plot` signature(x = "SamplingPattern", y = "missing"): plots sampling pattern x.
- `show` signature(object = "SamplingPattern"): prints object on the output device.

Author(s)
Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter

SamplingPatternCentroids-class

Class "SamplingPatternCentroids"

Description
A class for storing a sampling pattern, where the sampling locations are the centers of gravity of each stratum.

Objects from the Class
Objects can be created by calls of the form `new("SamplingPatternCentroids", ...)`. However, objects are usually created by calling `spsample`.

Slots
- `sample`: Object of class "SpatialPoints", containing the sampling locations.
SamplingPatternPriorPoints-class

Description

A class for storing a sampling pattern consisting of existing points and new points. The new points are the centers of gravity of their stratum.

Objects from the Class

Objects can be created by calls of the form new("SamplingPatternPriorPoints", ...). However, objects are usually created by calling spsample.

Slots

isPriorPoint: Object of class "logical", which is TRUE if the location is a prior point, and FALSE if it is not.
sample: Object of class "SpatialPoints", containing the sampling locations

Extends

Methods

plot signature(x = "CompactStratification", y = "SamplingPatternPriorPoints"): plots sampling pattern y on top of stratification x.

plot signature(x = "SamplingPatternPriorPoints", y = "missing"): plots sampling pattern x.

Author(s)

Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter
SamplingPatternPurposive-class

Class "SamplingPatternPurposive"

Description
An ancestor class for storing purposive sampling patterns.

Objects from the Class
Objects can be created by calls of the form `new("SamplingPatternPurposive", ...)`.

Slots
sample: Object of class "SpatialPoints", containing the sampling locations

Extends
Class "SamplingPattern", directly.

Methods
No methods defined with class "SamplingPatternPurposive" in the signature.

Author(s)
Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter

SamplingPatternRandom-class

Class "SamplingPatternRandom"

Description
An ancestor class for storing random sampling patterns.

Objects from the Class
Objects can be created by calls of the form `new("SamplingPatternRandom", ...)`.

Slots
sample: Object of class "SpatialPoints", containing the sampling locations

Extends
Class "SamplingPattern", directly.

Methods
No methods defined with class "SamplingPatternRandom" in the signature.
SamplingPatternRandomComposite-class

Class "SamplingPatternRandomComposite"

Description
A class for storing composites obtained by random sampling.

Objects from the Class
Objects can be created by calls of the form new("SamplingPatternRandomComposite", ...). However, objects are usually created by calling spsample.

Slots
composite: Object of class “integer”, indicating to which composite sample a sampling unit belongs.
sample: Object of class "SpatialPoints", containing the sampling locations.

Extends

Methods
coerce signature(from = "SamplingPatternRandomComposite", to = "data.frame"): coerces to "data.frame".
coerce signature(from = "SamplingPatternRandomComposite", to = "SpatialPointsDataFrame"): coerces to "SpatialPointsDataFrame".
estimate signature(statistic = "SpatialMean", stratification = "CompactStratificationEqualArea", samplingPattern = "SamplingPatternRandomComposite", data = "data.frame"): estimates the spatial mean. See "SpatialMean" for more details.
getSampleSize signature(object = "SamplingPatternRandomComposite"): returns the sample size per stratum.
plot signature(x = "CompactStratification", y = "SamplingPatternRandomComposite"): plots sampling pattern y on top of stratification x.
plot signature(x = "SamplingPatternRandomComposite", y = "missing"): plots sampling pattern x.

Author(s)
Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter
SamplingPatternRandomSamplingUnits-class

Class “SamplingPatternRandomSamplingUnits”

Description

A class for storing sampling units obtained by random sampling.

Objects from the Class

Objects can be created by calls of the form new("SamplingPatternRandomSamplingUnits", ...). However, objects are usually created by calling spsample.

Slots

sample: Object of class "SpatialPoints", containing the sampling locations.

Extends

Methods

estimate signature(statistic = "SamplingVariance", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame")

estimates the sampling variance. See "SamplingVariance" for more details.

estimate signature(statistic = "SpatialCumulativeDistributionFunction", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame")

estimates the spatial cumulative distribution function (SCDF). See "SamplingPatternRandomSamplingUnits" for more details.

estimate signature(statistic = "SpatialMean", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame")

estimates the spatial mean. See "SpatialMean" for more details.

estimate signature(statistic = "SpatialVariance", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame")

estimates the spatial variance. See "SpatialVariance" for more details.

estimate signature(statistic = "StandardError", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame")

estimates the standard error of the spatial mean. See "StandardError" for more details.

estimate signature(statistic = "character", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame")

estimates statistic, i.e., "spatial mean", "spatial variance", "sampling variance", "standard error", SCDF.

Author(s)

Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter
Class "SamplingVariance"

Description

Objects from the Class
Objects can be created by calls of the form new("SamplingVariance", ...).

Slots
description: Object of class "character" A description of the statistic.

Extends
Class "Statistic", directly.

Methods

Methods

estimate signature(statistic = "SamplingVariance", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame"):
estimates the sampling variance, given a stratification, a sampling pattern and data.

estimate signature(statistic = "SamplingVariance", stratification = "CompactStratificationEqualArea", samplingPattern = "SamplingPatternRandomComposite", data = "data.frame"):
estimates the sampling variance, given a stratification, a sampling pattern and data.

Author(s)
Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter

References

Class "SpatialCumulativeDistributionFunction"

Description
The spatial cumulative distribution function (SCDF) is estimated by applying Equation 7.13 in de Gruijter et al., (2006) to indicator transformations of the data. See also page 83 of de Gruijter et al., (2006).

Objects from the Class
Objects can be created by calls of the form new("SpatialCumulativeDistributionFunction", ...).
Slots

description: Object of class "character" A description of the statistic.

Extends

Class "Statistic", directly.

Methods

estimate signature(statistic = "SpatialCumulativeDistributionFunction", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame")
estimates the spatial cumulative distribution function (SCDF), given a stratification, a sampling pattern and data.

Author(s)

Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter

References

SpatialMean-class

Class "SpatialMean"

Description

The spatial mean is estimated by means of Equation 7.13 in de Gruijter et al., (2006).

Objects from the Class

Objects can be created by calls of the form new("SpatialMean", ...).

Slots

description: Object of class "character" A description of the statistic.

Extends

Class "Statistic", directly.

Methods

estimate signature(statistic = "SpatialMean", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame")
estimates the spatial mean, given a stratification, a sampling pattern and data.

estimate signature(statistic = "SpatialMean", stratification = "CompactStratificationEqualArea", samplingPattern = "SamplingPatternRandomComposite", data = "data.frame")
estimates the spatial mean, given a stratification, a sampling pattern and data.

Author(s)

Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter

SpatialVariance-class  Class "SpatialVariance"

Description

The spatial variance is estimated by means of Equation 7.16 in de Grujter et al., (2006).

Objects from the Class

Objects can be created by calls of the form new("SpatialVariance", ...).

Slots

description: Object of class "character" A description of the statistic.

Extends

Class "Statistic", directly.

Methods

estimate signature(statistic = "SpatialVariance", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame")

estimates the spatial variance, given a stratification, a sampling pattern and data.

Spatial Sampling of Compact Strata

Description

Methods for sampling in compact strata.
StandardError-class

Methods

x = "CompactStratification", n = "missing", type = "missing"  samples the centroids of each stratum.

x = "CompactStratification", n = "numeric", type = "missing"  stratified simple random sampling with n samples per stratum.

x = "CompactStratificationEqualArea", n = "numeric", type = "character"  if type = "composite", stratified simple random sampling of n composites.

x = "CompactStratificationPriorPoints", n = "missing", type = "missing"  spatial infill sampling

See Also

stratify for stratification, spsample for other types of spatial sampling, and estimate for inference.

Examples

# Note: the example below requires the 'rgdal'-package.
# You may consider the 'maptools'-package as an alternative
if (require(rgdal)) {

  # read a vector representation of the 'Farmsum' field
  shpFarmsum <- readOGR(
    dsn = system.file("maps", package = "spcosa"),
    layer = "farmsum"
  )

  # stratify 'Farmsum' into 50 strata
  # NB: increase argument 'nTry' to get better results
  set.seed(314)
  myStratification <- stratify(shpFarmsum, nStrata = 50, nTry = 1)

  # sample two sampling units per stratum
  mySamplingPattern <- spsample(myStratification, n = 2)

  # plot the resulting sampling pattern on
  # top of the stratification
  plot(myStratification, mySamplingPattern)
}

------------------------------------------------------------------

StandardError-class  Class "StandardError"

Description

Objects from the Class

Objects can be created by calls of the form new("StandardError", ...).
Statistic-class

Slots

description: Object of class "character" A description of the statistic.

Extends

Methods

estimate signature(statistic = "StandardError", stratification = "CompactStratification", samplingPattern = "SamplingPatternRandomSamplingUnits", data = "data.frame")

estimates the standard error, given a stratification, a sampling pattern and data.

Author(s)

References

<table>
<thead>
<tr>
<th>Statistic-class</th>
<th>Class &quot;Statistic&quot;</th>
</tr>
</thead>
</table>

Description

A superclass (ancestor class) for statistics to estimate.

Objects from the Class

A virtual Class: No objects may be created from it.

Slots

description: A description of the statistic

Methods

show signature(object = "Statistic"): prints the statistic

Author(s)

Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter
**Description**

Virtual class to store a spatial stratification.

**Objects from the Class**

A virtual Class: No objects may be created from it.

**Methods**

- `show` signature(object = "Stratification"): a method for printing objects of class Stratification

**Author(s)**

Dennis J. J. Walvoort <dennis.walvoort@wur.nl>, D.J. Brus, J.J. de Gruijter

**Examples**

`showClass("Stratification")`

---

**stratify-methods**

Methods for partitioning a spatial object into compact strata by means of $k$-means. The objective function to minimize is the mean squared shortest distance (MSSD). Optionally, the strata may be forced to be of equal size. This facilitates field work in case of stratified simple random sampling for composites. Another option is spatial infill sampling, a variant of spatial coverage sampling where existing sampling points are taken into account. Use `nTry > 1`, to reduce the risk of ending up in an unfavorable local optimum. Better results will generally be obtained by increasing the ratio `nGridCells/nStrata` and by increasing `nTry`.

**Usage**

```r
## S4 method for signature 'SpatialPixels'
stratify(object, nStrata, priorPoints = NULL, maxIterations = 1000, nTry = 1,
         equalArea = FALSE, verbose = getOption("verbose"))
## S4 method for signature 'SpatialGrid'
stratify(object, nStrata, priorPoints = NULL, maxIterations = 1000, nTry = 1,
         equalArea = FALSE, verbose = getOption("verbose"))
## S4 method for signature 'SpatialPolygons'
stratify(object, nStrata, priorPoints = NULL, maxIterations = 1000, nTry = 1,
         nGridCells = 2500, cellSize, equalArea = FALSE, verbose = getOption("verbose"))
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>an object of class &quot;SpatialPixels&quot;, &quot;SpatialGrid&quot; or &quot;SpatialPolygons&quot;</td>
</tr>
<tr>
<td>nStrata</td>
<td>number of strata (nStrata &gt;= 1).</td>
</tr>
<tr>
<td>priorPoints</td>
<td>object of class &quot;SpatialPoints&quot;, containing the prior (i.e., existing) points</td>
</tr>
<tr>
<td>maxIterations</td>
<td>maximum number of iterations.</td>
</tr>
<tr>
<td>nTry</td>
<td>the stratify method will try nTry initial configurations and will keep the best solution in order to reduce the risk of ending up with an unfavorable solution.</td>
</tr>
<tr>
<td>nGridCells</td>
<td>in case object is an instance of class &quot;SpatialPolygons&quot;, the approximate number of grid cells to be used for discretizing the vector map in object.</td>
</tr>
<tr>
<td>cellSize</td>
<td>in case object is an instance of class &quot;SpatialPolygons&quot;, the cell size to be used for discretizing the vector map in object. Note that cellSize takes precedence over argument nGridCells.</td>
</tr>
<tr>
<td>equalArea</td>
<td>If FALSE the algorithm results in compact strata. If TRUE, the algorithm results in compact strata of equal size.</td>
</tr>
<tr>
<td>verbose</td>
<td>if TRUE, progress information and intermediate results will be printed to the output device.</td>
</tr>
</tbody>
</table>

Methods

- **object = "SpatialPixels"** Stratify a raster representation of the study area.
- **object = "SpatialPolygons"** Stratify a vector representation of the study area.

Note

The stratify method may raise an error when the projection attributes ("CRS") have been set. A solution is to remove these attributes by calling the following function from the sp-package: `proj4string(myMap) <- NA_character_`, where `myMap` is the map to be stratified.

References
